## PROJECT PROFILE

**PROJECT:** Residential Apartment Block - External Wall Protection  
**LOCATION:** United Kingdom

### THE PROBLEM

The exterior walls of this residential apartment block located in a town on the South Coast of England had deteriorated due to the effects of time and the coastal environment.

The owners of the apartment block approached Thortex for a long-term solution, which would upgrade the appearance of the external walls of the building as well as protect them from the coastal weather and pollution.

### THE SOLUTION

The Thortex Wall-Tech FP system was recommended for this project based on its outstanding waterproofing, weatherproofing and anti-carbonation properties.

Appropriate surface preparation was carried out to ensure that the substrate was clean, dry and free from contamination. The walls were then treated with Uni-Tech GP Primer prior to the application of Wall-Tech FP.

Wall-Tech FP is a single component, water-based flexible protection system for external walls. It is also micro-porous and thus allows the substrate to breathe.
