PROJECT PROFILE

PROJECT: Label Manufacturer - Hygienic Floor Protection
LOCATION: United Kingdom

THE PROBLEM

The client prints labels for major food manufacturers, which had requested that its factory needed to be maintained to the same stringent hygiene standards as their production areas.

Principally, this involved the application of a hygienic floor coating to the previously untreated concrete floor.

THE SOLUTION

The floor was grit blasted, ensuring any resultant dust and debris was removed. Areas of porous concrete were primed with Floor-Tech SP Primer and non-porous areas were treated with Uni-Tech GP Primer. Floor-Tech HB was then applied to the entire surface.

Floor-Tech HB is a two component, solvent-free, high build epoxy coating. It is simple, safe, easy-to-use and provides a durable, seamless surface which is easy to clean. It is therefore ideal for use in food factories, dairies, breweries, pharmaceutical plants and warehouses.

The movement joints were then re-instated using the fluid grade version of our solvent-free elastomeric caulking compound Seal-Tech SS.
