PROJECT PROFILE

PROJECT: Babka Tower Block – Fire Escape Stair Protection
LOCATION: Poland

THE PROBLEM

The concrete fire escape stairs, extending throughout the newly built 30-floor Babka Tower Block in Warsaw, were badly damaged due to the ongoing building works inside the building.

The client approached Thortex for a high performance refurbishment solution, which would offer a durable rapid drying floor protection system that could be applied without the need for a primer.

THE SOLUTION

The concrete was mechanically abraded, before areas of damaged concrete were repaired using a cost-effective system comprising Floor-Tech SP Primer mixed with clean, dry silica sand. Two coats of Floor-Tech WBX were then applied.

Floor-Tech WBX is a water-based, fast-curing, self-priming, low gloss coating for use on most floor surfaces.

The client was delighted with the results of the application, which was carried out in a very short space of time and the substantial costs savings made.
