PROJECT PROFILE

PROJECT: Prison House Block - Hygienic Wall Protection
LOCATION: United Kingdom

THE PROBLEM

The internal blockwork walls at this new build prison accommodation block required long-term protection.

The prison required a hygienic coating that would offer flexibility to resist movement in the walls and reduce the visible profile of the blockwork. Thortex was approached for an immediate solution.

THE SOLUTION

The walls were suitably prepared prior to the application of three coats of Wall-Tech HF.

Wall-Tech HF is a single component, water-based acrylic coating designed for use as a flexible, mould and bacteria resistant hygienic finish for cementitious, metal and plaster surfaces. It has excellent elastomeric and crack bridging properties and provides optimum levels of UV resistance, adhesion and durability.

The Works Department was delighted with the success of the application.
