PROJECT PROFILE

PROJECT: KPMG Industrial Unit – Roof Refurbishment
LOCATION: United Kingdom

THE PROBLEM

The asbestos cement roof of this industrial unit owned by KPMG had deteriorated over time and was in need of refurbishment.

KPMG sought a high performance liquid applied roof coating, which would provide a waterproof and weatherproof membrane offering long-term protection and superior resistance to the elements.

The roof area to be refurbished totalled 3,000m².

THE SOLUTION

The substrate was cleaned and any dirt and debris removed. Areas of moss and lichen growth were treated with Thortex Fungicidal Wash. The Poly-Tech WG system was then applied to the roof by one of our Authorised Applicators, TRC Service Group Ltd.

Poly-Tech WG is a single component, flexible roof coating which has been specifically designed to enable application at low temperatures. It can be applied to most roof surfaces including asphalt, mineral felt, asbestos cement, concrete and metal substrates.

The external plastisol cladding of the industrial unit was also refurbished using our single component, moisture-cured flexible coating Wall-Tech PU that can be applied directly onto clean, sound plastisol in one coat without the need for a primer.
